Study Building Information Modeling (BIM) Interoperability Mohammed Aldegeily, 2018 BIM has been playing an essential role in building construction projects in recent years. It was used to automate many tasks such as clash detection, 4D planning, and quantity takeoff among others. However, the interoperability of BIM still lacks in many fields across the architecture, engineering, and construction domains. This research studies the interoperability between architectural design and structural analysis. The goal is to explore structural analysis of BIM models through data transfer processes between different software platforms via three types of paths: 1. Application Programming Interface (API), 2. immediately connect which is the direct link between software programs from the same provider, and 3. indirect link which is the indirect transfer of information through third-party software or methods/algorithms. This research unfolds through examining and comparing the three paths with a special focus on the level of interoperability that can be achieved by using IFC data through the indirect link. IFC is the ISO-registered open and neutral data exchange standard for BIM. Although IFC was designed to be comprehensive in supporting all disciplines and phases of a building construction project, the author found that IFC exports from architectural design software usually lack essential information elements needed for structure analysis. Recommendations are made to help improve the IFC-based BIM interoperability between architectural design and structural analysis, which would support collaboration between architects and structural engineers with a smooth transfer of modeling information with minimum information loss, thus saving time and costs.

The Benefits of Using Building Information Modeling in Structural Engineering Cesar Augusto Hunt, 2013 This paper explores how the use of Building Information Modeling (BIM) can be a beneficial platform for structural engineers. The current state of BIM is analyzed, giving a general overview on how architectural, engineering, and construction firms are applying it on their projects. The applicability of BIM to structural engineering is discussed, and how it impacts the structural design and its workflow. The benefits of using BIM in structural engineering are then analyzed in the areas of productivity, coordination, and visualization, and a case study is developed to test the interoperability between BIM software and structural analysis software. The findings of this study provide useful information for everyone interested in increasing their knowledge on BIM technology in structural engineering.
