

ANATOMY AND PHYSIOLOGY

Introduction of Anatomy and Physiology

WHAT IS?

Anatomy

- Study of the structure and shape of the body and its parts.
- Observation is used to see sizes and relationships of parts.

Two kinds of Anatomy:

- Gross Anatomy**
 - Large Structures
 - Easily observable and can be seen by the naked eye
- Microscopic Anatomy**
 - Structures are too small to be seen
 - Cells and tissues can be viewed only with a microscope

Two Approaches to The Study of Anatomy:

- Systemic anatomy** - study of the body by systems, such as the cardiovascular, nervous, skeletal, and muscular systems
- Regional anatomy** - study of the organization of the body by areas.

Physiology

- Study of how the body and its parts work or function
- Structure determines what functions can occur
For example, the air sacs of the lungs have very thin walls, a feature that enables them to exchange gases and provide oxygen to the body

Two types of Physiology:

- Human physiology** - study of a specific organism, the human
- Cellular physiology and Systemic physiology** - subdivisions that emphasize specific organizational levels.

Characteristics Of Life

1. Organization
2. Metabolism
3. Responsiveness
4. Growth
5. Development
6. Reproduction

Levels of Structural Organization

1. **Atoms** - The basic building block of matter and chemistry. Contains three subatomic particles: protons, neutrons, and electrons.
2. **Molecules** - A group of two or more atoms that form the smallest identifiable unit.
3. **Cells** - The basic unit of life and the structural, functional, and biological units of all living beings.
4. **Tissues** - A group of cells that are similar in structure and perform a specific function.
5. **Organs** - A group of tissues in a living organism that have been adapted to perform a specific function.
6. **Organ systems** - A group of organs that work together to perform a certain function in an organism's body.
7. **Organisms** - A living thing that has an organized structure, can react to stimuli, reproduce, grow, adapt, and maintain homeostasis.

HOMEOSTASIS

Homeostasis — maintenance of relatively stable internal conditions. It is a dynamic state of equilibrium, or balance and it is necessary for normal body functioning and to sustain life. The disturbance in homeostasis results in disease is called homeostatic imbalance

Main Controlling Systems:

- Nervous System
- Endocrine System

All homeostatic control mechanisms have at least three components: receptor, control center, and effector

1. **Receptor**
 - Responds to changes in the environment (stimuli)
 - Sends information to control center along an afferent pathway
2. **Control center**
 - Determines set point
 - Analyzes information
 - Determines appropriate response
3. **Effector**
 - Provides a means for response to the stimulus
 - Information flows from control center to effector along efferent pathway

FEEDBACK MECHANISM

• Negative feedback

Includes most homeostatic control mechanisms

Shuts off the original stimulus or reduces its intensity
Works like a household thermostat

Any deviation from the set point is made smaller or is resisted
Does not prevent variation but maintains variation within a normal range.
